DESIGN THINKING
Case Study “Museum Collection Görlitz, Germany”

1 Empathize
2 Define
3 Ideate
4 Prototype
5 Test

My design thinking workflow follows a five-step process.

It begins with *empathizing* with users to understand their needs, followed by *defining* the core problem.
From there, I move into *ideation*, where I explore multiple concepts and solutions.
These ideas are then developed through *prototyping* and finally evaluated through *testing*.

1 Empathize

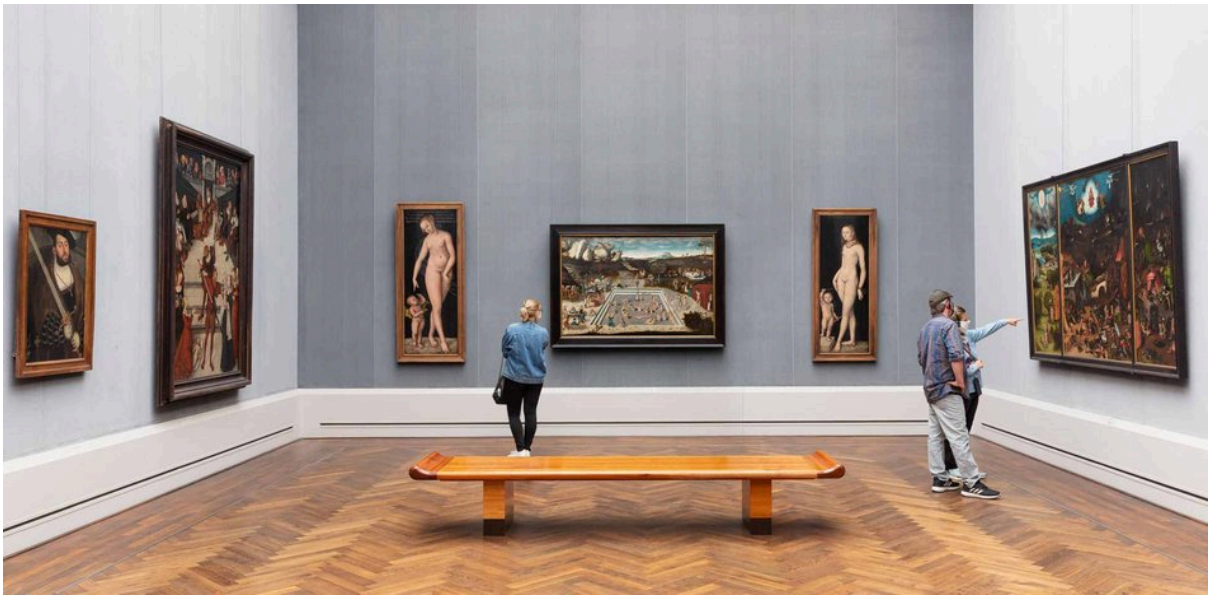

Context & Research Insights

While working on museum exhibitions, a recurring challenge became clear: families with children often disengage quickly from traditional, text-heavy formats.

This observation is supported by both professional experience (4 years working with museums) and research insights:

- A recent exhibition study (e.g. Picasso show) found that visitors spend **on average only 4 seconds** viewing an artwork, compared to **11 seconds in 2012**
- One possible explanation is the increasing influence of digital media consumption, leading to shorter attention spans
- Studies also show that **text length strongly affects engagement**:
    - Texts over 200 words are read by only **26%** of visitors
    - Texts around 100 words reach **59% readership**
- Additionally, **larger visual objects attract longer attention**, indicating the importance of visual hierarchy

These findings highlight a broader behavioral shift:
👉 Visitors scan rather than read, and engagement drops quickly without interaction or clear visual entry points.

Only 4 seconds of viewing per image is far too short

Conclusion

These insights suggest that **one-size-fits-all exhibition formats are no longer effective**.

Instead, museum experiences need to:

- Adapt to **shorter attention spans**
- Provide **layered content** for different audience groups
- Prioritize **visual engagement and interaction over long-form text**

For families in particular, this means:

- Designing **age-specific entry points** (children vs. adults)
- Offering **multiple ways to access content** (visual, interactive, audio)
- Creating experiences that encourage **active participation rather than passive reading**

This project started at a historical museum, where I was working on an exhibition aimed at a broad audience.

One key challenge was that *families with children often feel bored or disengaged* during traditional museum visits.
Standard exhibition formats and text-heavy content tend to be difficult for children to access, which can reduce overall engagement for the whole family.

The central question of the project was:
How might we make museum exhibition topics more engaging and interesting for families with children?

1 Empathize

As part of the Empathize phase, the focus was on understanding the visitors' experiences, frustrations, and needs.
The goal was to feel the pain points of families with children during museum visits and to identify why traditional exhibition formats often fail to engage them.

Smooth transition to Define

These insights from the Empathize phase helped shape a clearer understanding of the problem and laid the foundation for the Define phase.

Clean problem statement (design thinking style)

Families and children need an engaging and enjoyable museum experience that supports curiosity and interaction.

This will be successful when children actively participate in the exhibition and families spend more time engaging with the content.

Personas – Families Visiting the Museum

Child Persona 1: Max (8 years old, boy)

- ***Beliefs:*** *Museums are boring if there's too much reading.*
- ***Expectations:*** *Wants to see, touch, and play; expects stories and activities to be fun.*
- ***Frustrations:*** *Loses interest quickly with text-heavy displays.*
- ***Motivations:*** *Curious about history when it is interactive; likes challenges and games.*

Child Persona 2: Emma (6 years old, girl)

- ***Beliefs:*** *Museums can be exciting if they have colorful visuals or interactive exhibits.*
- ***Expectations:*** *Wants visual storytelling, hands-on activities, and surprises.*
- ***Frustrations:*** *Feels bored when activities are slow or adult-oriented.*
- ***Motivations:*** *Enjoys discovering new things; likes to share discoveries with family.*

Parent Persona 1: Sarah (Mother, 35 years old)

- ***Beliefs:*** *Museums should be educational but also enjoyable for her children.*
- ***Expectations:*** *Wants her children to learn while having fun; expects clear signage and easy-to-follow paths.*
- ***Frustrations:*** *Feels stressed when children get bored or restless.*
- ***Motivations:*** *Wants a positive family experience; values both education and engagement.*

Parent Persona 2: Tom (Father, 38 years old)

- ***Beliefs:*** *Museums are best experienced when children are interested and engaged.*
- ***Expectations:*** *Wants interactive exhibits that allow family participation.*
- ***Frustrations:*** *Feels exhibits are too passive or adult-focused; wants quality time with family.*
- ***Motivations:*** *Seeks memorable experiences; values hands-on learning and fun for children.*

“How Might We” Questions

For Children (Max & Emma)

- ***HMW make the exhibition fun and interactive, so children stay engaged?***
- ***HMW use storytelling and visual elements to spark curiosity in children?***
- ***HMW design hands-on activities that let children explore and learn actively?***

For Parents (Sarah & Tom)

- ***HMW create a family-friendly experience that allows parents and children to enjoy together?***
- ***HMW reduce frustration for parents when children lose interest?***
- ***HMW make educational content enjoyable and accessible for both children and adults?***

Combined / Overarching HMW

- ***HMW transform museum visits into a memorable experience for the whole family?***
- ***HMW encourage interaction and participation across all age groups in the exhibition?***
- ***HMW balance educational content with playful and engaging experiences?***

3 Ideation / Concept Development phase.

Augmented Reality of the dinosaurs models

Integration Concepts – Engaging Families

1. Interactive Storytelling Zones

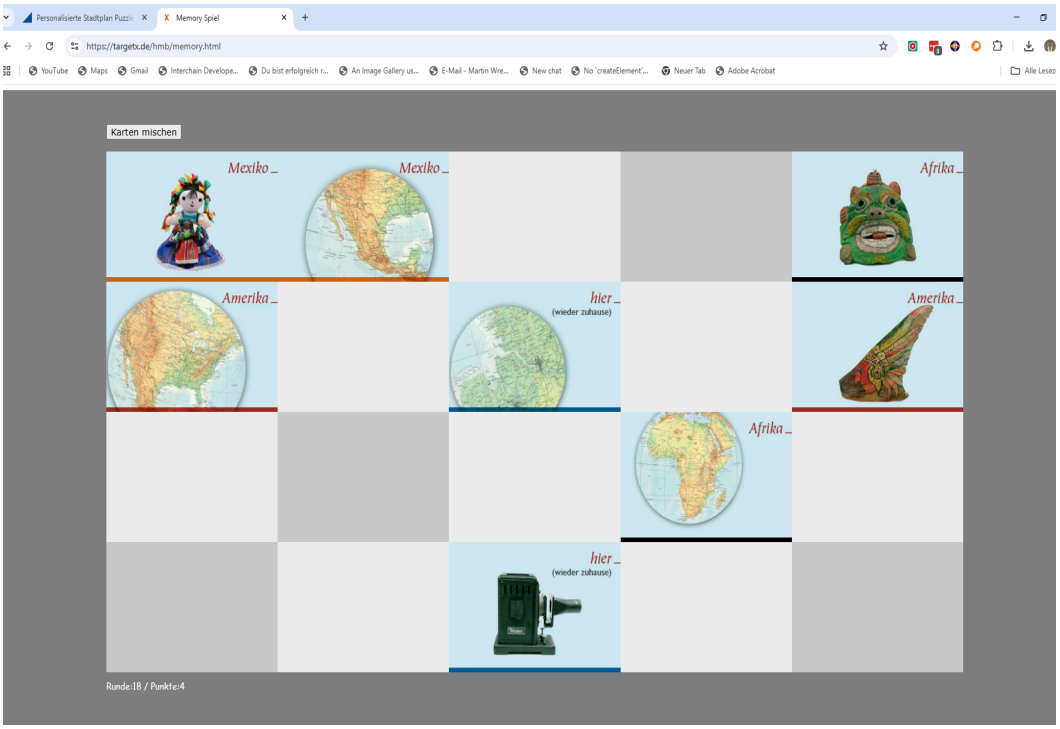

- *Children follow a narrative adventure through the exhibition (Max & Emma).*
- *Touchscreens, props, or augmented reality let them discover objects and stories.*
- *Parents (Sarah & Tom) can guide children or explore extra content at their own pace.*
- ***Benefit:** Keeps children engaged while offering learning for parents.*

2. Hands-On Activity Stations

- *Stations where children can build, touch, or experiment with replicas or materials.*
- *Tasks are designed to be short, fun, and shareable with parents.*

- ***Example:*** *History puzzles, artifact reconstruction, or interactive map games.*
- ***Benefit:*** *Direct engagement encourages exploration and family participation.*

3. Gamified Exhibition Path

Online Memory Game with the main topics of an exhibition

- *A "museum quest" where children collect stamps, solve clues, or complete challenges.*
- *Parents can track progress and encourage participation.*
- *Integration with small rewards (stickers, certificates) for motivation.*
- ***Benefit:*** *Creates a playful structure that increases dwell time and attention.*

4. Visual & Multimedia Enhancement

- *Colorful graphics, animations, or projection mapping highlight key stories.*

- *Interactive panels allow children to control what they see or hear.*
- ***Benefit:** Appeals to visual learners and keeps younger audiences curious.*

5. Family Reflection / Sharing Spaces

- *Areas at the end of exhibits for families to discuss what they learned or create something together.*
- *Could include collaborative drawing boards, photo moments, or digital storytelling stations.*
- ***Benefit:** Extends learning, creates memorable experiences, and encourages repeat visits.*

6. Individual text descriptions and audio guides

- *Instead, one solution fits all, with different text versions for different categories of visitors:*
  adult, young adult, child (boy), child (girl)

4 Prototype

Prototype – Narrative Entry Point for Family Engagement

To explore how storytelling and interaction could increase engagement, a prototype was developed in the form of a narrative-driven exhibition poster.
The concept introduces a set of characters, each representing a different museum location (e.g. towers, museum houses, library). These characters act as guides through the exhibition, creating a cohesive story across multiple spaces.

Each character is linked to additional content via QR codes, allowing visitors to access:

- **Background stories**
- **Interactive elements (e.g. games or challenges)**
- **Extended information tailored to different age groups**

Hypothesis

The prototype was designed to test the assumption that:

- **Story-driven navigation increases engagement, especially for children**
- **Visitors are more likely to explore multiple locations when guided by characters and narrative continuity**
- **Interactive, on-demand content (QR codes) encourages deeper exploration compared to static text**

Problem-Solution Fit

This approach directly addresses key challenges identified in the research phase:

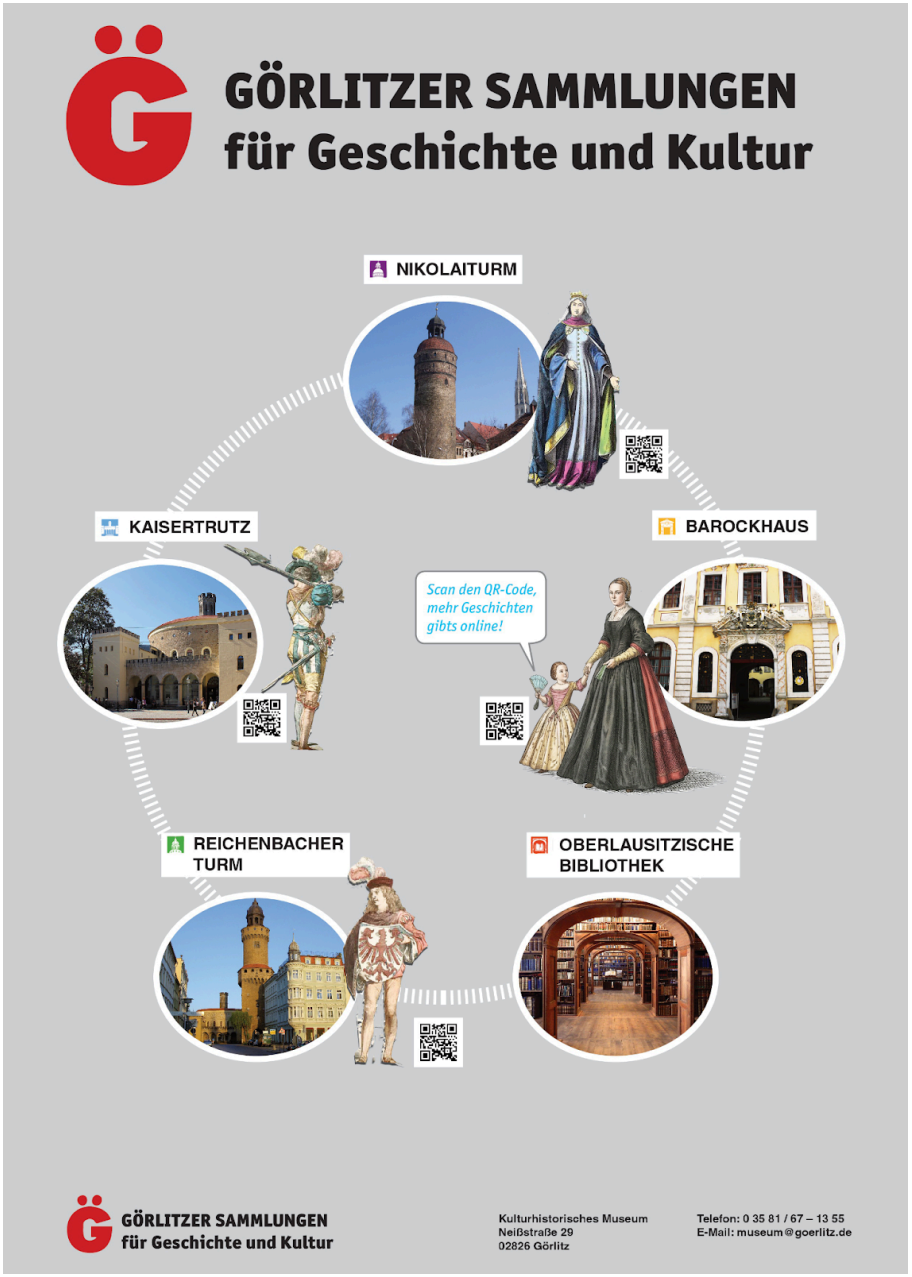

- **Short attention spans → replaced by bite-sized, story-based content**
- **Text-heavy exhibitions → complemented with interactive and visual storytelling**
- **Lack of engagement for children → solved through playful characters and exploration**

Why this prototype

This prototype was chosen because it allows testing multiple aspects at once:

- **Narrative engagement**
- **Cross-location experience**
- **Digital interaction via QR codes**

At the same time, it remains low-cost and easy to implement, making it realistic for museum environments.

Poster

Each historic character represents the museum locations:
1 Nikolaiturm: Aunt “Alex”
2 Barockhaus: girl “Emma”
3 Oberlausitzische Bibliothek: mother “Sarah”
3 Reichenbacher Turm: teenage boy “Max”
4 Kaisertrutz: father “Tom”

The QR code on the poster would be linked to more background stories of the places and each character. In this way, we could offer stories about the history of the places, develop games, and books that could be sold to visitors in the bookstore.
The problem I want to solve:
I wanted to create a concept that fits to all the specific historical museum places

Prototype – Narrative & Spatial Experience

*To explore how storytelling and interaction could increase engagement, a prototype was developed as a **combined visual and spatial concept**.*

The prototype consists of two integrated elements:

- *A **narrative-driven poster system**, introducing characters that represent different museum locations*
- *A set of **spatial visualizations (3D views)** showing how these characters and interaction points could be placed within the museum and across the city*

Together, they form a cohesive experience that guides visitors through exhibitions using story, space, and interaction.

Concept

*Each character represents a specific location (e.g. towers, museum houses, library) and acts as a **guide through the exhibition journey**.*

- *Visitors encounter characters as **physical elements** (e.g. standees, signage)*
- *QR codes connect to **additional digital content**, such as stories, games, or deeper information*
- *The narrative continues across locations, encouraging exploration beyond a single exhibition space*

The 3D visualizations illustrate how these elements function in context:

- *Placement of characters at key decision points (entrances, transitions, highlights)*
- *Visibility and scale within exhibition spaces*
- *Interaction moments between visitors and the installation*

Hypothesis

The prototype was designed to test the following assumptions:

- ***Story-driven navigation increases engagement****, especially for children*
- *Visitors are more likely to explore multiple spaces when guided by* ***recognizable characters***
- ***Physical presence + digital interaction (QR codes)*** *creates a stronger connection than static text alone*
- *Spatial placement of interactive elements can* ***influence movement and dwell time***

Problem–Solution Fit

This approach directly responds to the challenges identified in the research phase:

- ***Short attention spans*** *→ addressed through bite-sized, narrative content*
- ***Text-heavy exhibitions*** *→ complemented with visual, interactive elements*
- ***Low engagement of families*** *→ improved through playful guidance and shared experiences*

By combining storytelling with spatial design, the prototype shifts the experience from ***passive reading to active exploration.***

5 Test

Initial Validation & Stakeholder Feedback

The concept was presented to museum stakeholders and city officials from the tourism department as part of an early validation phase.

*Overall, the feedback was very positive. Stakeholders particularly appreciated the **broad and strategic scope of the concept**, which went beyond their initial expectations and introduced new ways of engaging families across multiple museum locations.*

*At the same time, the discussion revealed that some of the underlying assumptions about the **specific context of the museum and the city of Görlitz** were not fully accurate. This highlighted gaps in contextual and stakeholder-specific research.*

Key Learnings

- *Early stakeholder involvement is valuable to **validate the strategic direction**, even before user testing*
- *Assumptions based on prior experience should be complemented with **context-specific research***
- *Aligning concepts with **operational and local realities** is critical for successful implementation*

Next Steps

Based on this feedback, the next iteration would include:

- *Deeper collaboration with local stakeholders*
- *More targeted research into the museum's visitors and city tourism dynamics*
- *Validation of concepts with actual families through usability testing*
